

Why Use Naiad Soil Penetrant?

The short answer is to get more from each irrigation and rainfall event.

Experience shows water doesn't always move into soil uniformly, it often follows paths of least resistance. This fact means that soil drainage, fertigation applications and salt leaching irrigations are inherently non-uniform. Lack of uniformity results in stronger and weaker portions of each field and adds expense and costs production.

Applications of Naiad in conjunction with certain fertilizers or alone will improve the uniformity of water movement in your soils. This can result in more efficient fertilizer use, reduction of saturated spots for a healthier crop and greater salt leaching. Many growers report additional benefits too.

Our unique formula allows for low use rates.

Use 1 quart per acre initially, followed by 1 pint per acre in 2 weeks and again monthly after that. Please ask your dealer representative about compatibility with fertilizers you would co-apply with.

See your local Naiad dealer representative for further information on benefits specific to your field situation.
